Programming... is a lot like cooking!

Functions

- Reusable code for performing a computation
- A function...
 - Takes in one or more parameters (or arguments)
 - Executes some code
 - Optionally returns a value

Anatomy of Functions

```
function weirdAddition(a, b) {
    var result = a + b - 0.5;
    return result;
}
```

Using Functions

• Calling functions invokes the set of instructions it represents

- Parameters to the function are specified between the parens
- Multiple arguments are separated by commas

```
argument to the function
c = convertToCelsius(60);
                      function convertToCelsius(f) {
                         var celsius = 5/9 * (f-32);
                         return celsius;
```

More Examples

var r = weirdAddition(2, 4);

var a = 2; var b = 3; var s = weirdAddition(a, b);

function weirdAddition(a, b) {
 var result = a + b - 0.5;
 return result;
}

You've already been doing it!

- Built in functions:
 - prompt("enter some text", "default");
 - alert("message here");
- Message handlers!

Cooking analogy?

Objects

• It's just a collection of properties!

var fido = {
 name: "Fido",
 weight: 40,
 breed: "Mixed",
 loves: ["walks", "fetching balls"]
};

Objects and Properties

• Access object properties using the "dot" notation

```
var w = fido.weight;
fido.breed = "Yellow Lab";
```

• Where have we seen this before?

Wine demo (Part I)

Objects: Methods

- It's just a collection of properties!
- Objects can have functions also! (called methods)

var fido = {
 name: "Fido",
 weight: 40,
 breed: "Mixed",
 loves: ["walks", "fetching balls"],
 bark: function() {
 alert("Woof woof!");
 }
}

Calling a Method

- Invoke an object's method using the dot notation: fido.bark();
- It's just like a function call!
- Where have you seen this before?
- What's "this"?

What's the point?

- Claim: every method can be rewritten as a ordinary function, and vice versa?
- Why have methods? What's the advantage of functions directly to objects?

Wine demo (Part 2)

Constructor!

• So far, building objects is a tedious process... that's where constructors come in:

function Dog(name, breed, weight) { this.name = name;this.breed = breed;this.weight = weight; this.bark = function() { if (this.weight > 25) { alert(this.name + " says Woof!"); } else { alert(this.name + " says Yip!");

Using Constructors

• Invoke constructors using "new":

```
var fido = new Dog("Fido", "Mixed", 38);
var tiny = new Dog("Tiny", "Chawalla", 8);
var clifford = new Dog("Clifford", "Bloodhound", 65);
```

```
fido.bark();
tiny.bark();
clifford.bark();
```

Wine demo (Part 3)

It'll all make sense today...
