Structure of the Course

Analyzing Text

Analyzing Graphs

Analyzing
Relational Data

Data Mining

“Core” framework features
and algorithm design

Evolution of Enterprise Architectures

Next two sessions: techniques, algorithms, and optimizations for relational processing

users

Monolithic
Application

users

Frontend

Backend

users

Frontend

Backend

database

Why is this a good idea?

Business Intelligence

An organization should retain data that result from carrying out its mission and exploit those data to generate insights that benefit the organization, for example, market analysis, strategic planning, decision making, etc.

Duh!?

analysts

Why is my application so slow?

Why does my analysis take so long?

Database Workloads

OLTP (online transaction processing)

Typical applications: e-commerce, banking, airline reservations

User facing: real-time, low latency, highly-concurrent

Tasks: relatively small set of “standard” transactional queries

Data access pattern: random reads, updates, writes (small amounts of data)

OLAP (online analytical processing)

Typical applications: business intelligence, data mining

Back-end processing: batch workloads, less concurrency

Tasks: complex analytical queries, often ad hoc

Data access pattern: table scans, large amounts of data per query

OLTP and OLAP Together?

Downsides of co-existing OLTP and OLAP workloads

Poor memory management
Conflicting data access patterns
Variable latency

users and analysts

Solution?

Build a data warehouse!

users

Frontend

Backend

OLTP database for
user-facing transactions

ETL

(Extract, Transform, and Load)

OLAP database for
data warehousing

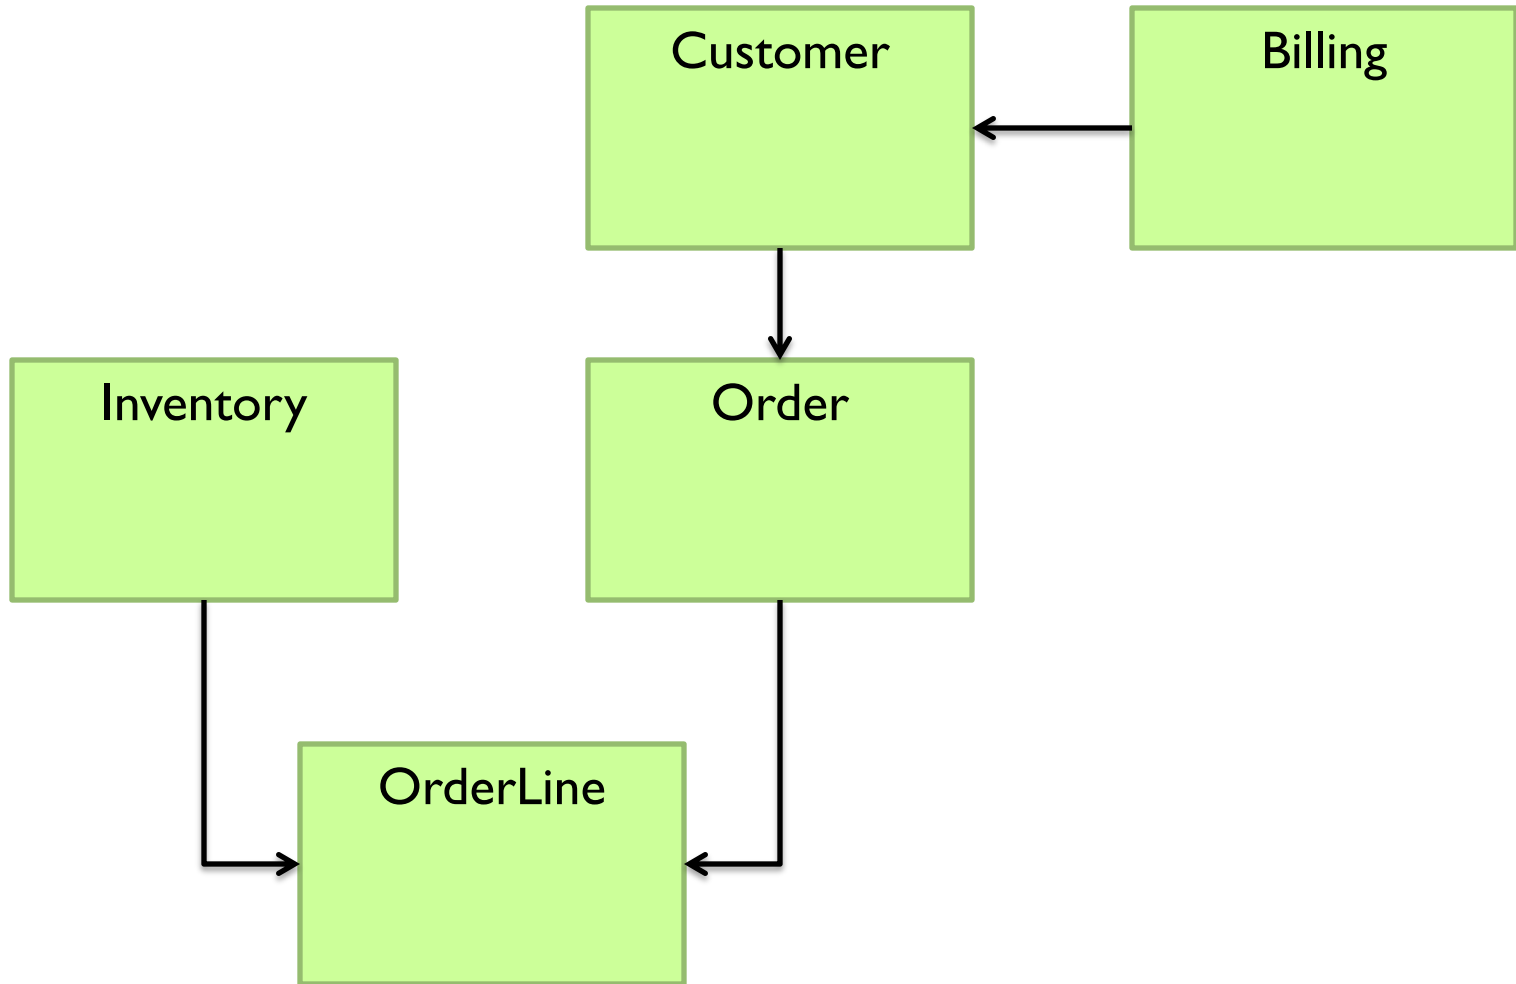

BI tools

analysts

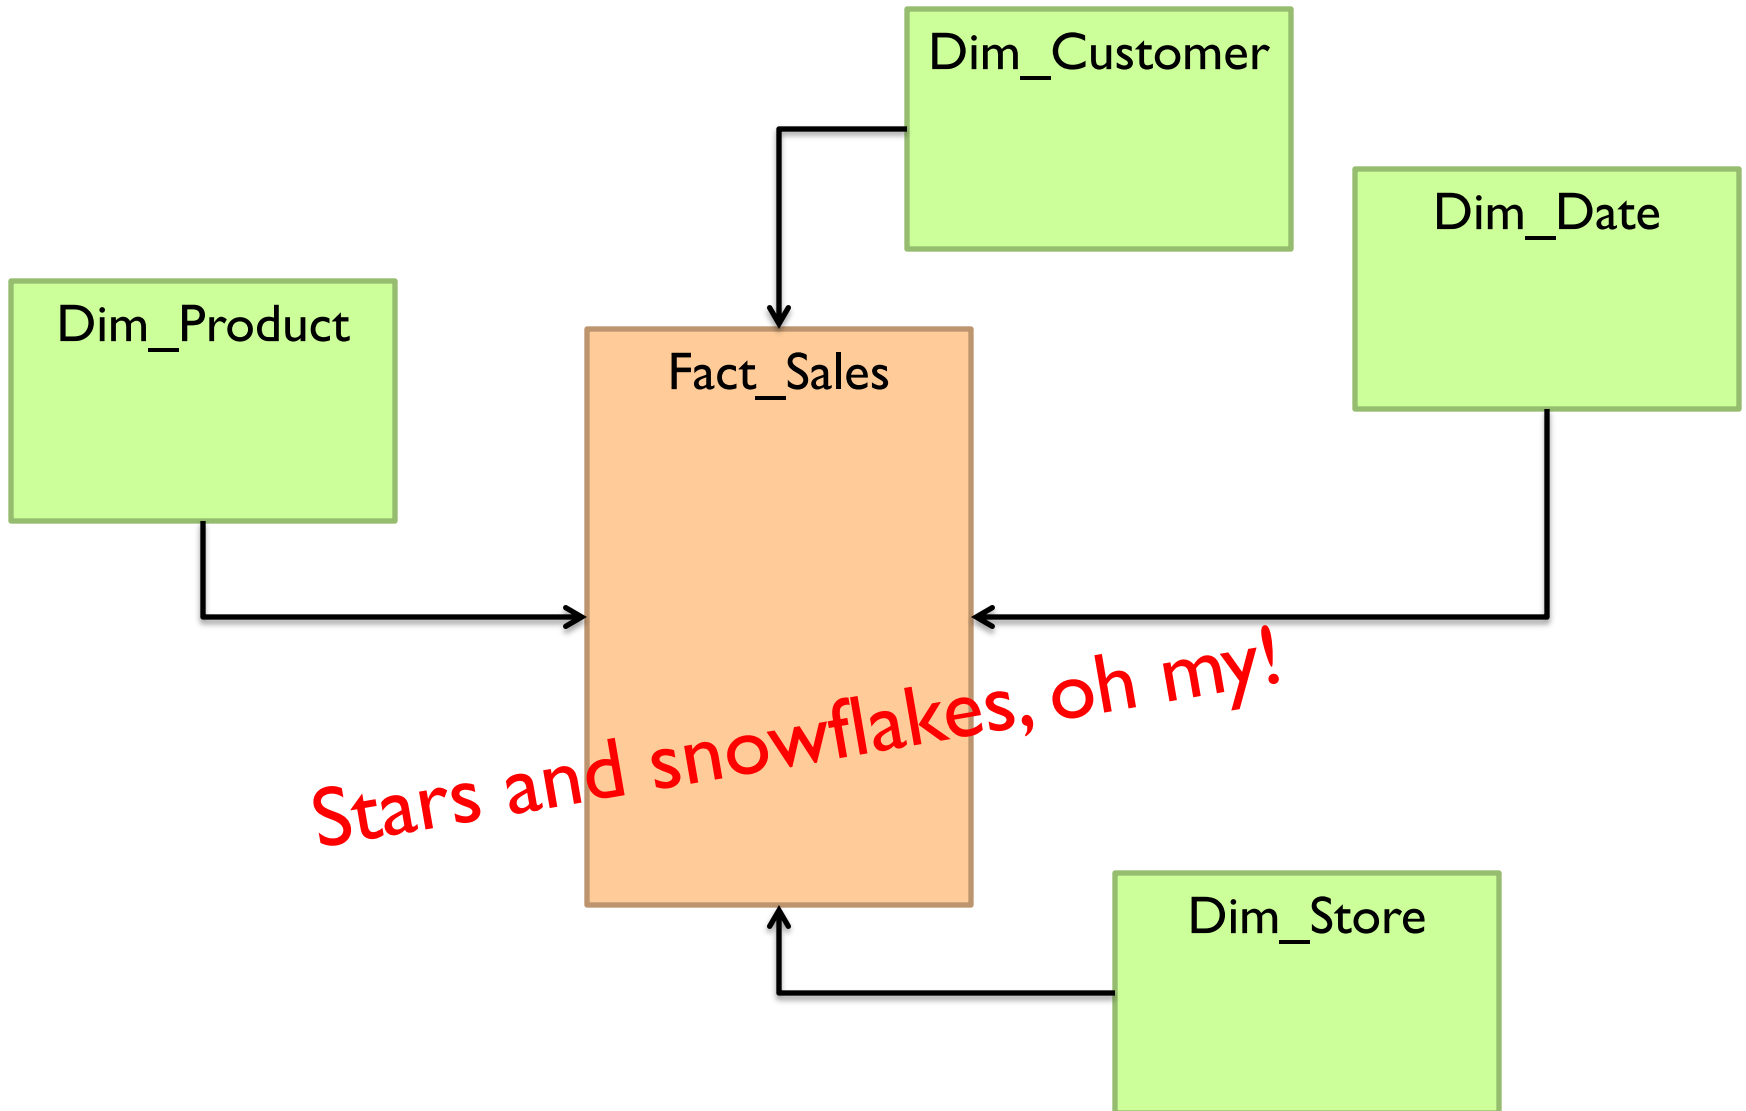

What's special about
OLTP vs. OLAP?

A Simple OLTP Schema

A Simple OLAP Schema

ETL

Extract

Transform

Data cleaning and integrity checking

Schema conversion

Field transformations

Load

When does ETL happen?

users

Frontend

Backend

OLTP
database

ETL

(Extract, Transform, and Load)

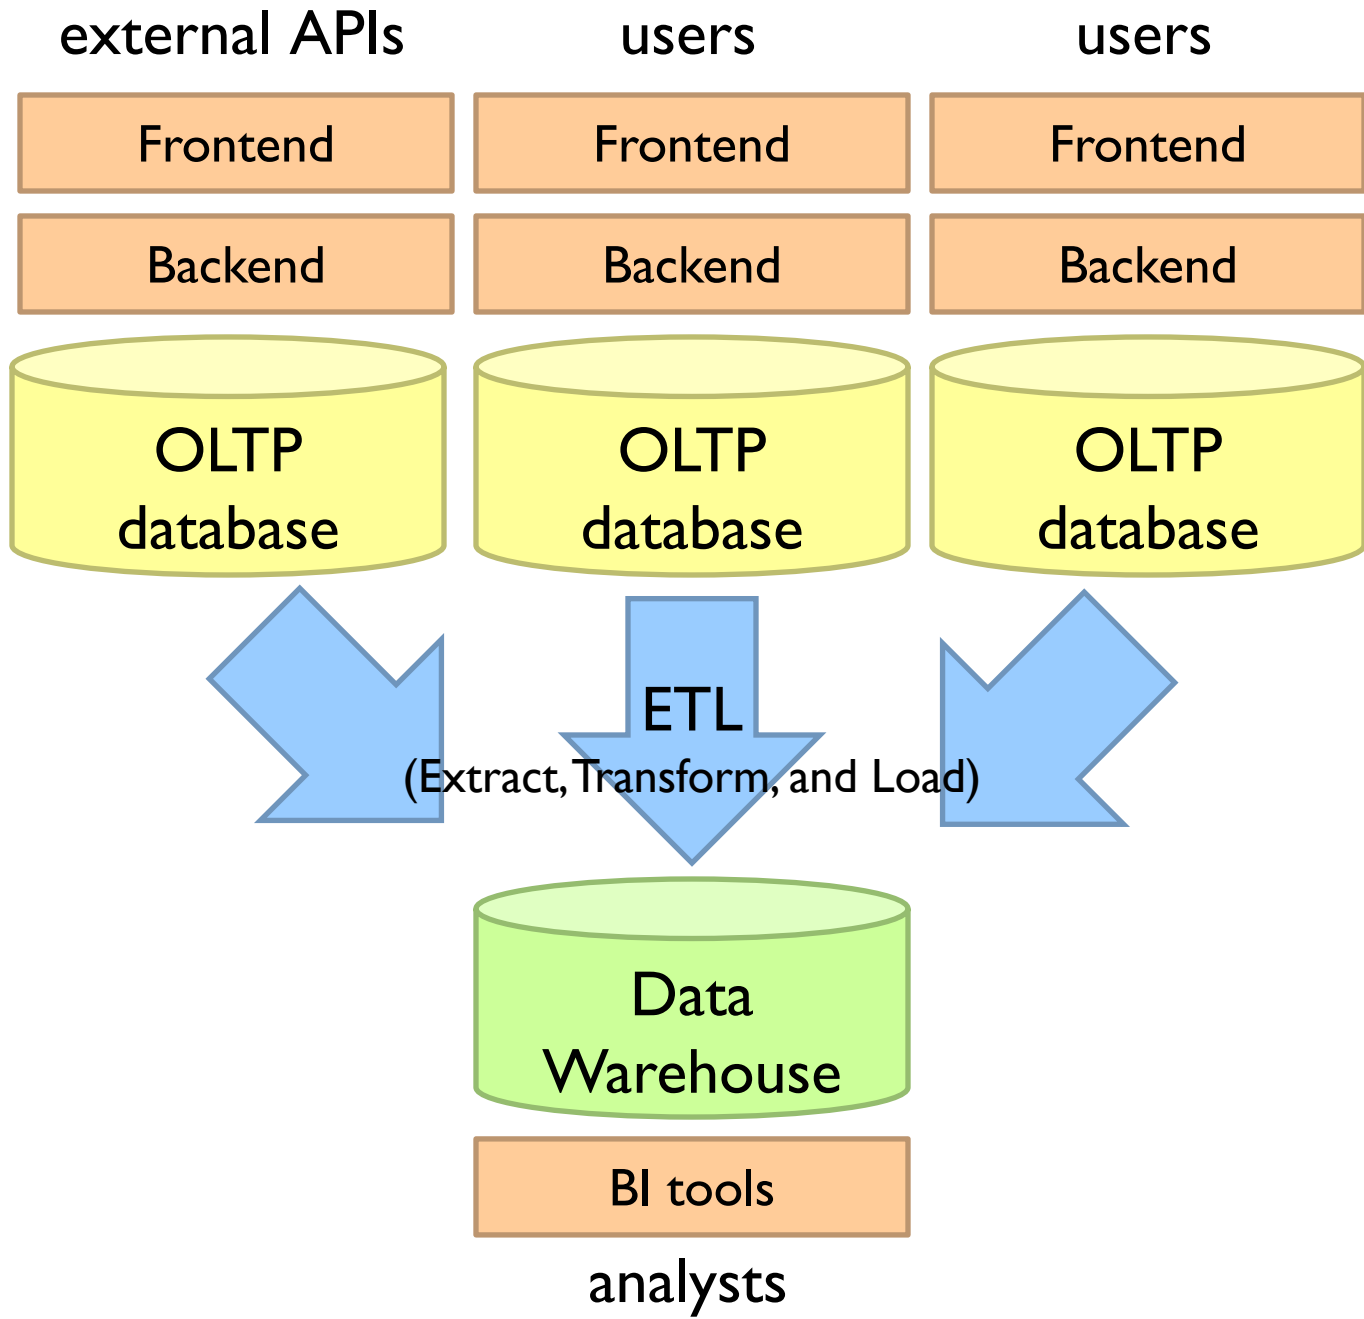

Data
Warehouse

My data is a
day old...

BI tools

Meh.

analysts

What do you actually do?

Report generation

Dashboards

Ad hoc analyses

OLAP Cubes

Common operations

slice and dice

roll up/drill down

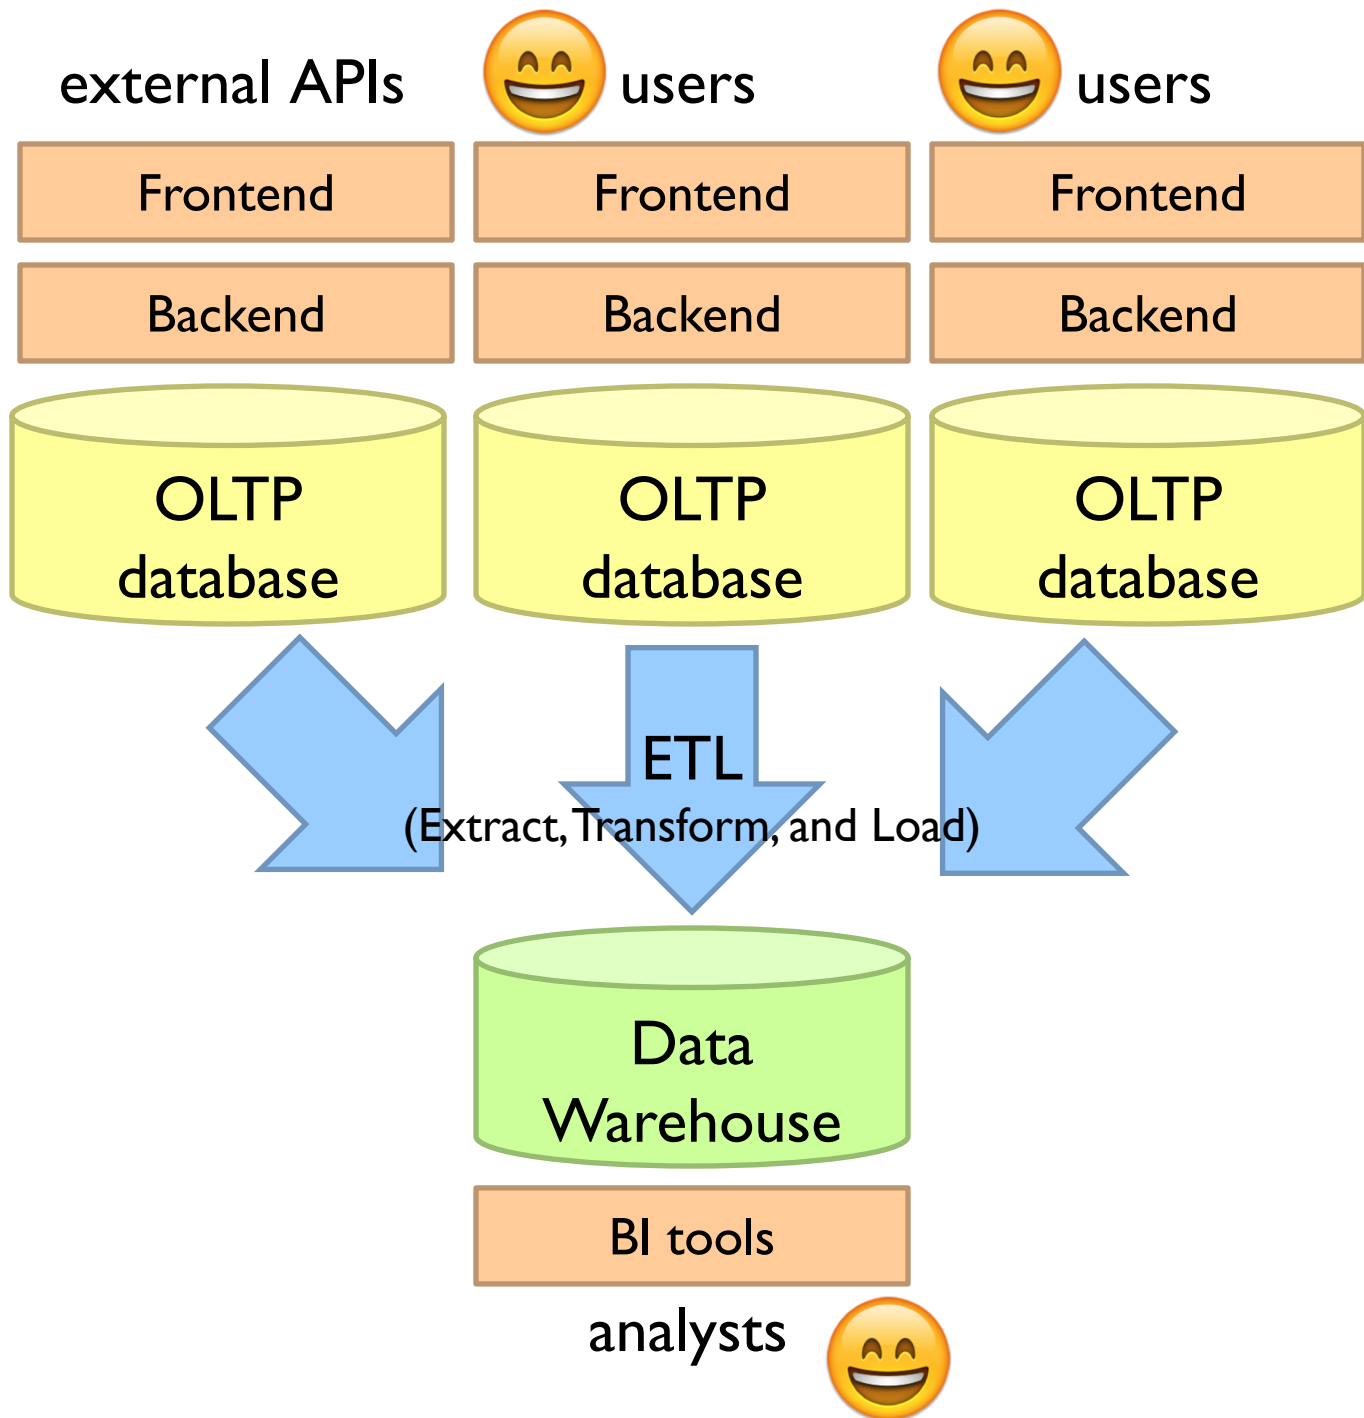

pivot

OLAP Cubes: Challenges

Fundamentally, lots of joins, group-bys and aggregations
How to take advantage of schema structure to avoid repeated work?

Cube materialization

Realistic to materialize the entire cube?
If not, how/when/what to materialize?

Fast forward...

facebook®

Jeff Hammerbacher, Information Platforms and the Rise of the Data Scientist.
In, *Beautiful Data*, O'Reilly, 2009.

“On the first day of logging the Facebook clickstream, more than 400 gigabytes of data was collected. The load, index, and aggregation processes for this data set really taxed the Oracle data warehouse. Even after significant tuning, we were unable to aggregate a day of clickstream data in less than 24 hours.”

What'

Droppi

Cheaper to store everything

5 MB hard drive in 1956

What's changed?

Dropping cost of disks

Cheaper to store everything than to figure out what to throw away

Types of data collected

From data that's *obviously* valuable to data whose value is less apparent

Rise of social media and user-generated content

Large increase in data volume

Growing maturity of data mining techniques

Demonstrates value of data analytics

Virtuous Product Cycle

a useful service

(hopefully)

transform insights
into action

analyze user behavior
to extract insights

Google. Facebook. Twitter. Amazon. Uber.

What do you actually do?

Report generation

Dashboards

Ad hoc analyses

“Descriptive”

“Predictive”

The Irony...

Wait, so why not use a database to begin with?

Why not just use a database?

SQL is awesome

Scalability. Cost.

Databases are great...

If your data has structure (and you know what the structure is)

If your data is reasonably clean

If you know what queries you're going to run ahead of time

Databases are not so great...

If your data has little structure (or you don't know the structure)

If your data is messy and noisy

If you don't know what you're looking for

“there are known knowns; there are things we know we know. We also know there are known unknowns; that is to say we know there are some things we do not know. But there are unknown unknowns – the ones we don't know we don't know...” – Donald Rumsfeld

Databases are great...

If your data has structure (and you know what the structure is)

If your data is reasonably clean

If you know what queries you're going to run ahead of time

Known unknowns!

Databases are not so great...

If your data has little structure (or you don't know the structure)

If your data is messy and noisy

If you don't know what you're looking for

Unknown unknowns!

Advantages of Hadoop dataflow languages

Don't need to know the schema ahead of time

Raw scans are the most common operations

Many analyses are better formulated imperatively

Much faster data ingest rate

What do you actually do?

Report generation

Dashboards

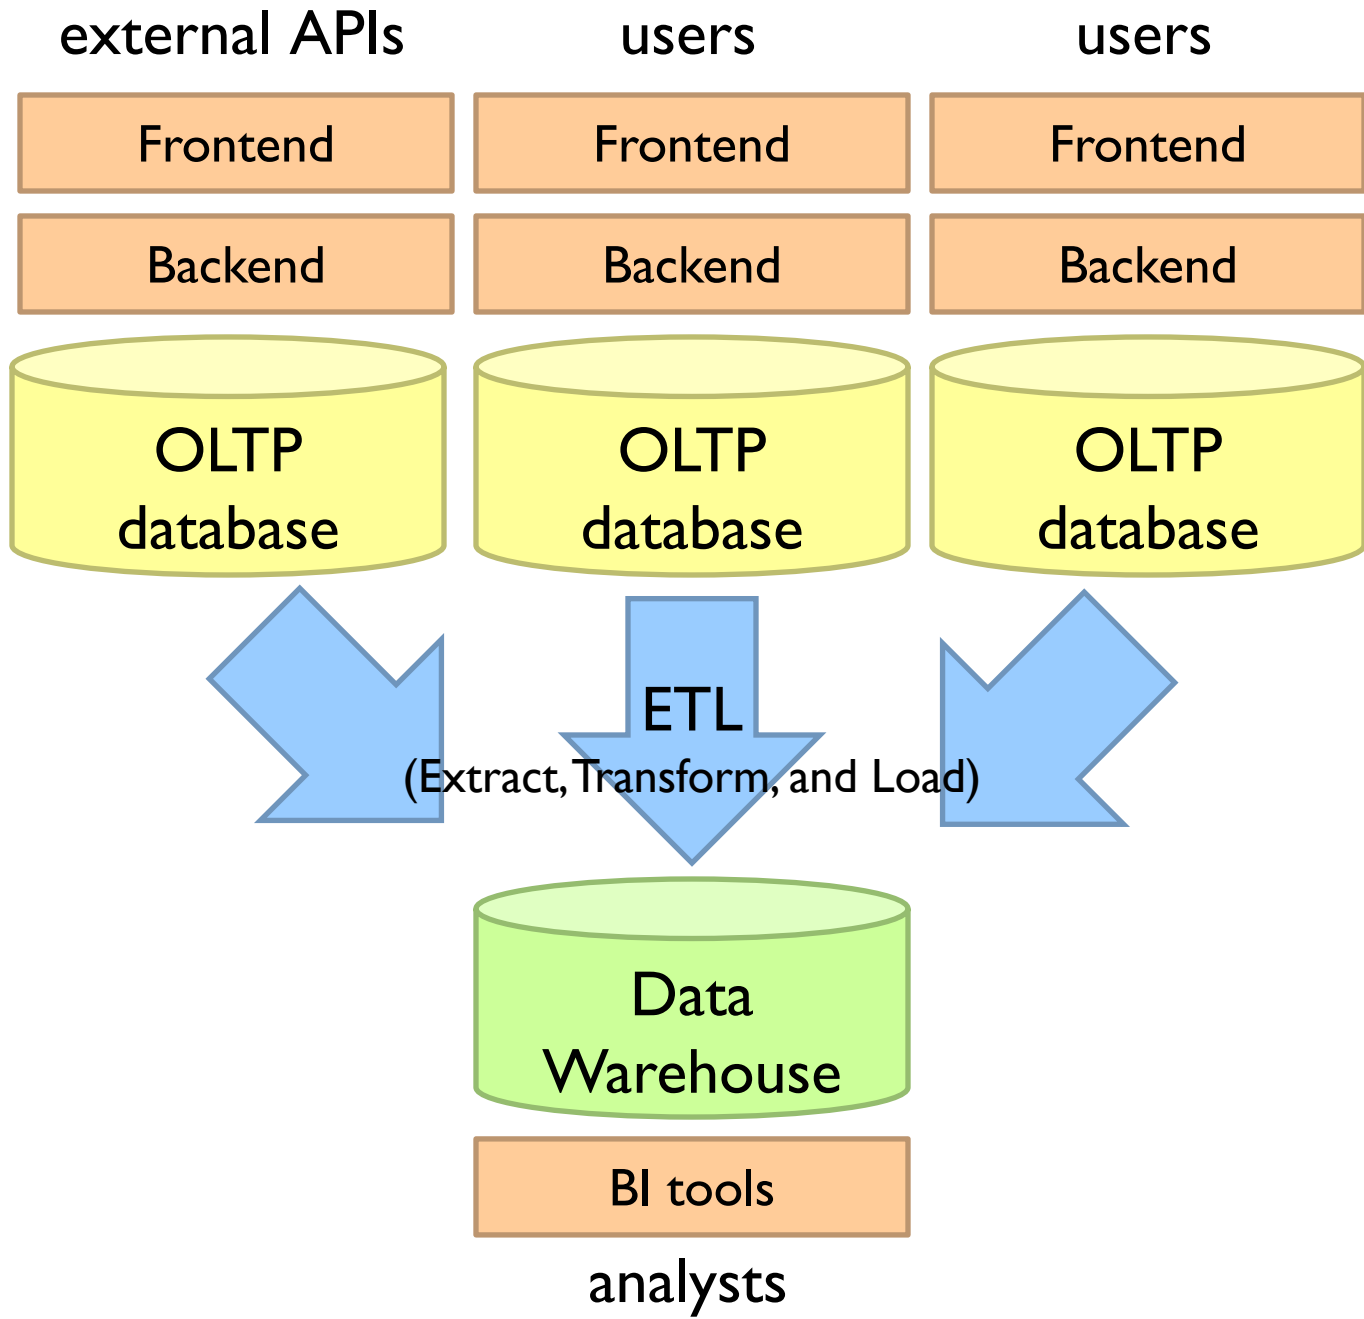

Ad hoc analyses

“Descriptive”

“Predictive”

Data products

Which are known unknowns and
unknown unknowns?
